# SHEA abstracts related to surface environmental hygiene issues

# Today's Presentation

- A new understanding healthcare surfaces microbial ecology
- Defining the risk of transmission from surfaces
- Addressing suboptimal cleaning practice
- Does improved practice matter?
- Approaches to monitoring hygienic practice in healthcare

The new (clarified)  
understanding of the  
healthcare surface  
environment

# You Can't Escape from Germs!

# The microbial ecology of patient zone surfaces

**All** pathogens traditionally associated with health care transmission survive well on surfaces

# Survival of Pathogens on Dry Environmental Surfaces

| Pathogen            | Survival time on dry environmental surface |
|---------------------|--|
| <i>C. difficile</i> | >5 months                                  |
| Staphylococci       | 7 months                                   |
| VRE                 | 4 months                                   |
| Acinetobacter       | 5 months                                   |
| Norovirus           | 3 weeks                                    |
| Adenovirus          | 3 months                                   |
| Rotavirus           | 3 months                                   |
| Hepatitis C         | 4 weeks                                    |

# Outbreak v. Non-outbreak VRE

**Figure 1.** Survival of an outbreak strain (E745; open squares) and a non-outbreak strain (E802; filled triangles) of vancomycin-resistant *Enterococcus faecium* (VRE<sub>Fm</sub>).

# The microbial ecology of patient zone surfaces

**All** Pathogens traditionally associated  
with health care transmission survive  
well on surfaces

Organism density is generally low but  
infective doses are low

# The microbial ecology of patient zone surfaces

**All** Pathogens traditionally associated with health care transmission survive well on surfaces

Organism density is generally low but infective doses are low

Most near-patient surfaces are sterile or contain  $< 2.5$  ACC / cm<sup>2</sup>. Therefore, simple cleanliness (culture, ATP) can not be used as a surrogate for thoroughness of cleaning

# Defining the risk of transmission

# Studies reporting a favorable impact of enhanced environmental hygiene during a CDAD outbreak

# Increased acquisition risk from prior room occupant

8 studies as of October 2010

Two additional studies showed very significant risk without quantification – Martinez (VRE) and Wilks (Acinetobacter)

Is there a better programmatic  
model ?

# The Health Care Environmental Hygiene Study Group Hospitals Program

To develop a surrogate marking system to **objectively** evaluate and improve the thoroughness of environmental cleaning/disinfection of the near-patient environment

# The Targeting Solution

A mixture of several glues, soaps and a targeting dye which:

- Dries rapidly

- Environmentally stable

- Readily wetted by spray disinfectants

- Easily removed with light abrasion

- Inconspicuous

# Target After Marking

# Target Enhanced

Evaluation of the thoroughness of disinfection cleaning has shown substantial opportunities for improvement in all health care venues studied in the U.S., Canada, Ireland and Australia

# Baseline Environmental Evaluation of 3 Acute Care Hospitals

# Baseline Environmental Evaluation of 35 Acute Care Hospitals

# Baseline Environmental Evaluation of 82 Acute Care Hospitals

# PROPORTION OF OBJECTS CLEANED AS PART OF TERMINAL ROOM CLEANING IN 20 ACUTE CARE HOSPITALS

# Thoroughness of Environmental Cleaning

## Phase I: Covert Baseline Environmental Cleaning Evaluation

## Phase II: A. Programmatic Analysis B. Educational Interventions – ES staff

## Phase III: Re-evaluation of Cleaning and feedback to ES

INFECTION CONTROL AND HOSPITAL EPIDEMIOLOGY NOVEMBER 2008, VOL. 29, NO. 11

ORIGINAL ARTICLE

# Improving Cleaning of the Environment Surrounding Patients in 36 Acute Care Hospitals

Philip C. Carling, MD; Michael M. Parry, MD; Mark E. Rupp, MD; John L. Po, MD, PhD; Brian Dick, MS, CIC;  
Sandra Von Beheren, RN, BSN, MS, CIC; for the Healthcare Environmental Hygiene Study Group

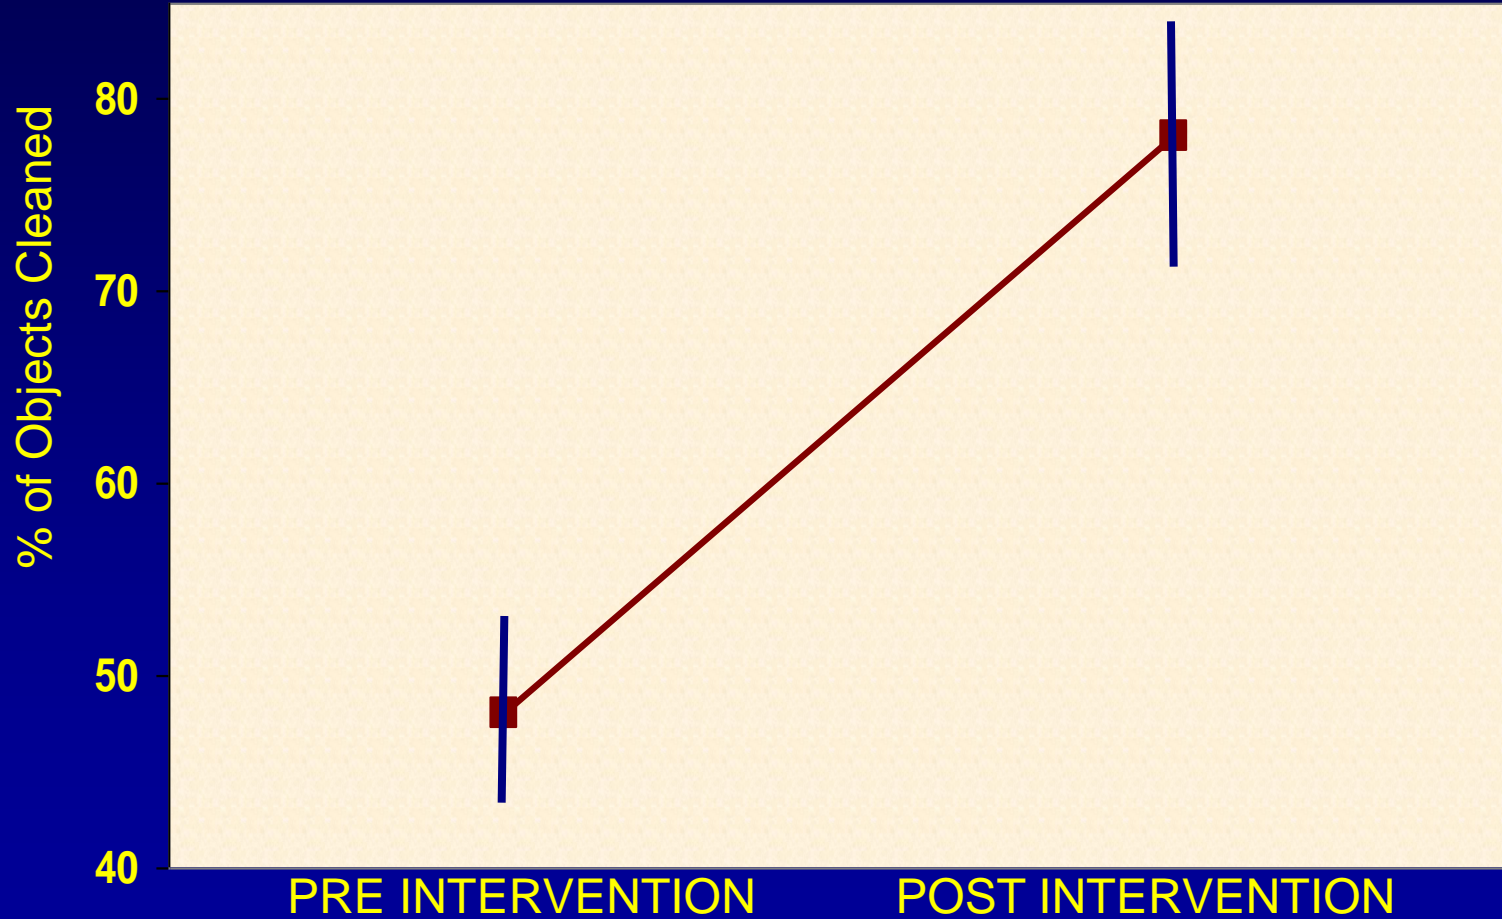

# RESULTS

# Terminal Room **Cleaning** Project – Three Programmatic Responses

# Hospitals Environmental Hygiene Study Group 36 Hospital Results

Resource Neutral

P = <.0001

Is it a surprise that this degree of improvement  
was resource neutral ??

Terminal Cleaning

So much for acute hospitals  
what about long term care?

## THE SNF ENVIRONMENTAL HYGIENE STUDY PICTORAL PRIMER

In this section:

1. Introduction
2. Pictorial examples of objects marked
3. Optimal marking and evaluation after cleaning

FIGURE 1: A patient room in a SNF

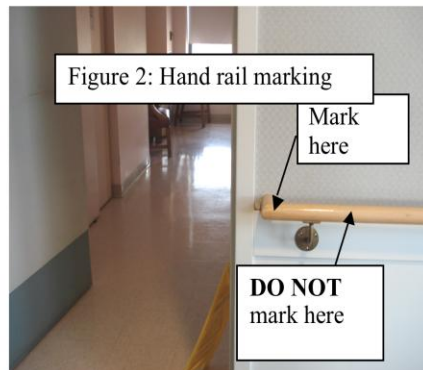

Unlike hospital ward rooms and similar rooms found in acute care facilities, patient rooms in SNFs are much more individualized, providing greater challenges in determining what areas can be marked in a consistent manner. Figure 1 represents a patient's room in a SNF which contains many personal items as well as objects which have been associated with the

transmission of bacterial and viral pathogens.

## PICTORAL EXAMPLES OF COMMON AREA OBJECT MARKING

### Handrails

For handrails (Figure 2), the optimal place for marking is at the end of the rail. Mark the face of the rail rather than on top to minimize the chance of hand contact with the target. Marking near the terminus of a rail will decrease the chance of the target being accidentally removed,

### Patient Lifts and Scales

The lift control panel and handle should be marked and the scale control panel and the metal part of the hand hold should be marked" (Figure 6 A and B). Since these devices may be moved around the facility, it is recommended that an additional mark be placed in an area that will not be cleaned to allow the device can be "tracked down" to determine whether or not the object is actually the one marked for evaluation or an identical unmarked object.

# CDC Recommendations

Acute Care Hospitals should implement a:

## Level I Program:

Basic interventions to optimize disinfection cleaning policies, procedures and ES staff education and practice.  
When completed move to Level II Program

## Level II Program:

All elements of Level I + Objective monitoring

**Options for Evaluating Environmental Cleaning**

October 2010

**Options for Evaluating Environmental Cleaning**

October 2010

National Center for Emerging and Zoonotic Infectious Diseases

Division of Healthcare Quality Promotion

So much for the why

Let's get to the how

# First establish a structure for the program

Infection Prevention

AND

Environmental  
Services

- Early joint planning to define expectations, clarify policies and foster mutual respect
- One sided programs fail on many levels

# Systems of Objectively Monitoring Hygienic Practice

What are the merits and limitations of the tools that can be used to objectively monitor the thoroughness of patient zone cleaning?

# Defining the Difference Between Cleaning and Cleanliness

|  | <b>Cleanliness</b>   | <b>Cleaning</b>                             |
|--|--|---|
| Definition   | A measure of bacteria on a surface   | Measured by evaluating process              |
| Defined Criteria   | No<br>“Cleanliness Standard”   | Compliance with existing cleaning policy    |
| Improvement shown to decrease bacterial transmission (Published) | None   | Two   |
| Impacted by  | Bioburden, thoroughness of recent cleaning, effectiveness of disinfectant, recent contamination or lack of | Thoroughness of evaluated cleaning practice |
| CDC endorsed to improve patient safety                           | No   | Yes   |

# Evaluating Patient Zone Environmental Cleaning

| <b>Method</b>              | <b>Ease of Use</b> | <b>Identifies Pathogens</b> | <b>Accuracy</b> | <b>Useful for Teaching</b> | <b>Use in Programmatic Monitoring</b> |
|----------------------------|--------------------|-----------------------------|-----------------|----------------------------|---------------------------------------|
| <b>Direct observation</b>  |                    |                             |                 |                            |                                       |
| <b>Culture swab</b>        |                    |                             |                 |                            |                                       |
| <b>Agar culture system</b> |                    |                             |                 |                            |                                       |
| <b>Fluorescent system</b>  |                    |                             |                 |                            |                                       |
| <b>ATP Bioluminescence</b> |                    |                             |                 |                            |                                       |

# Evaluating Patient Zone Environmental Cleaning

\* Measures cleanliness at that moment but **NOT** the process of cleaning

# Surface evaluation using ATP bioluminescence

Swab surface → Luciferase tagging of ATP → Hand held luminometer

# The ATP tool in context

## Industrial Use

- Developed in the 1970s for commercial food preparation
- Used when very clean surfaces are important
- High-grade disinfectants + Rinsing
- Testing immediately after cleaning and just before use is the standard

## Healthcare Use

- Griffiths – JHI studies – Effectively used cultures and ATP to debunk the “visibly clean ” standard
- He and later Dancer showed that most surfaces had both high bacterial and ATP counts (89% of surfaces “Failed”) (many appeared dirty!)
- The Hygienic standard is proposed

# Limitations of ATP evaluation of cleanliness in healthcare settings

Two independent studies of ATP sensitivity and specificity have clarified the limits of the ATP “Cleanliness Standard” as it was proposed several years ago

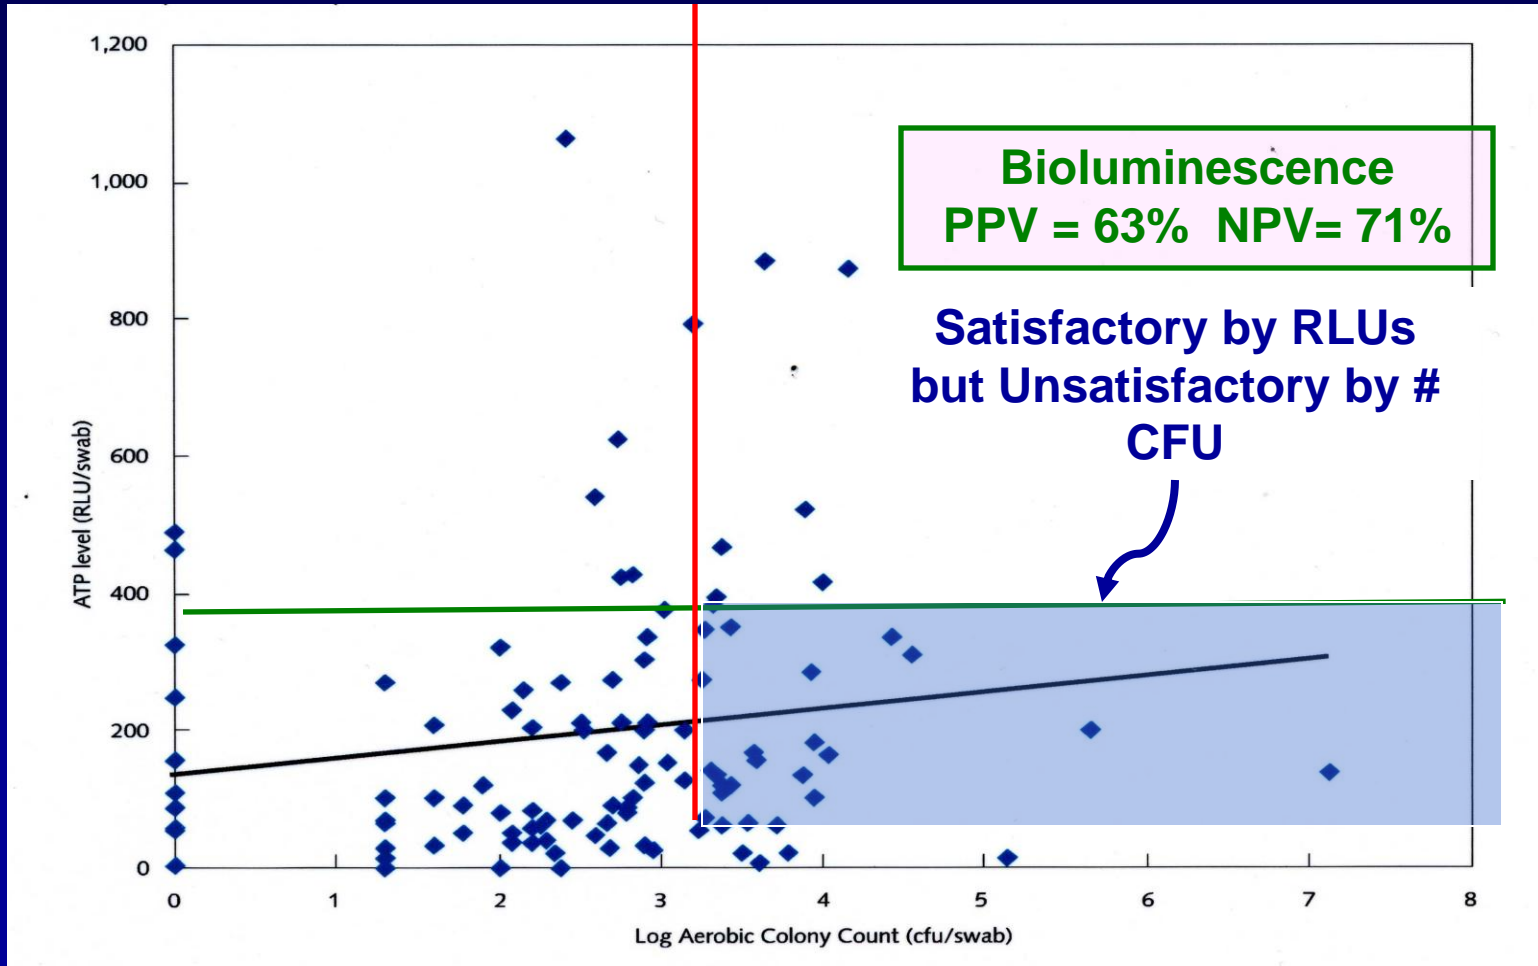

# Evaluation of ATP bioluminescence swabbing as a monitoring and training tool for effective hospital cleaning

2007

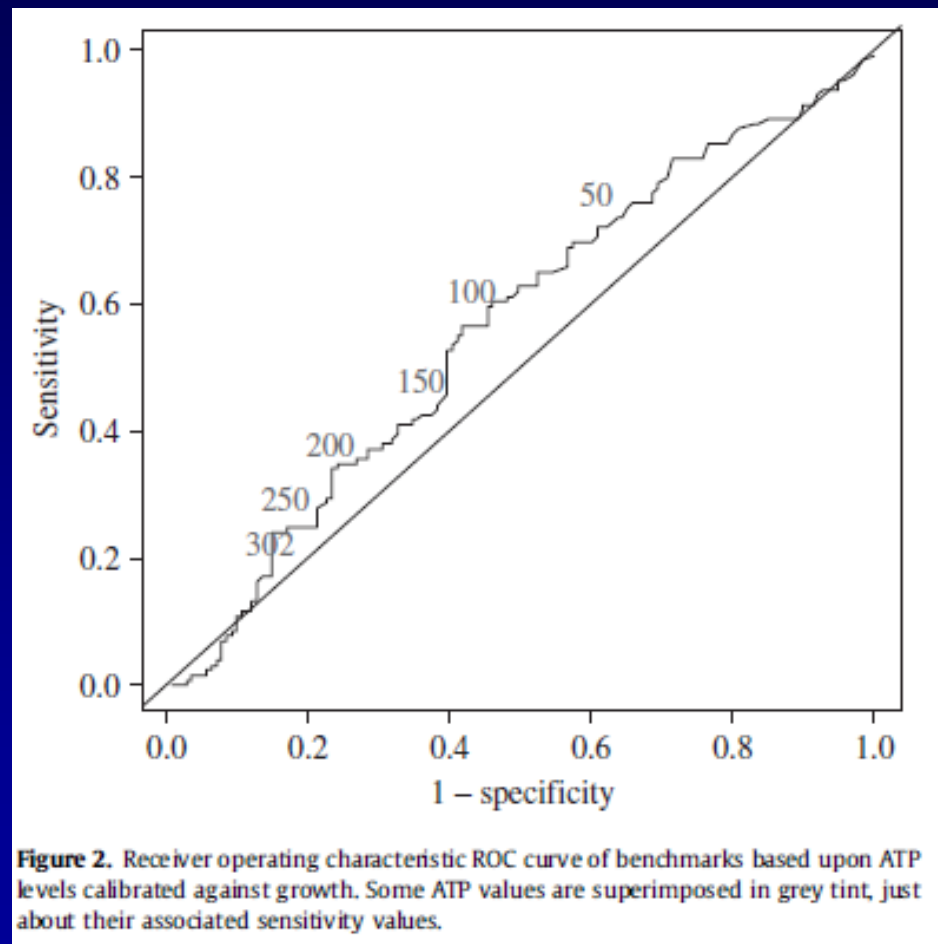

# Correlation between ATP bioluminescence (RLU/Swab) and aerobic colony count (cfu/swab)

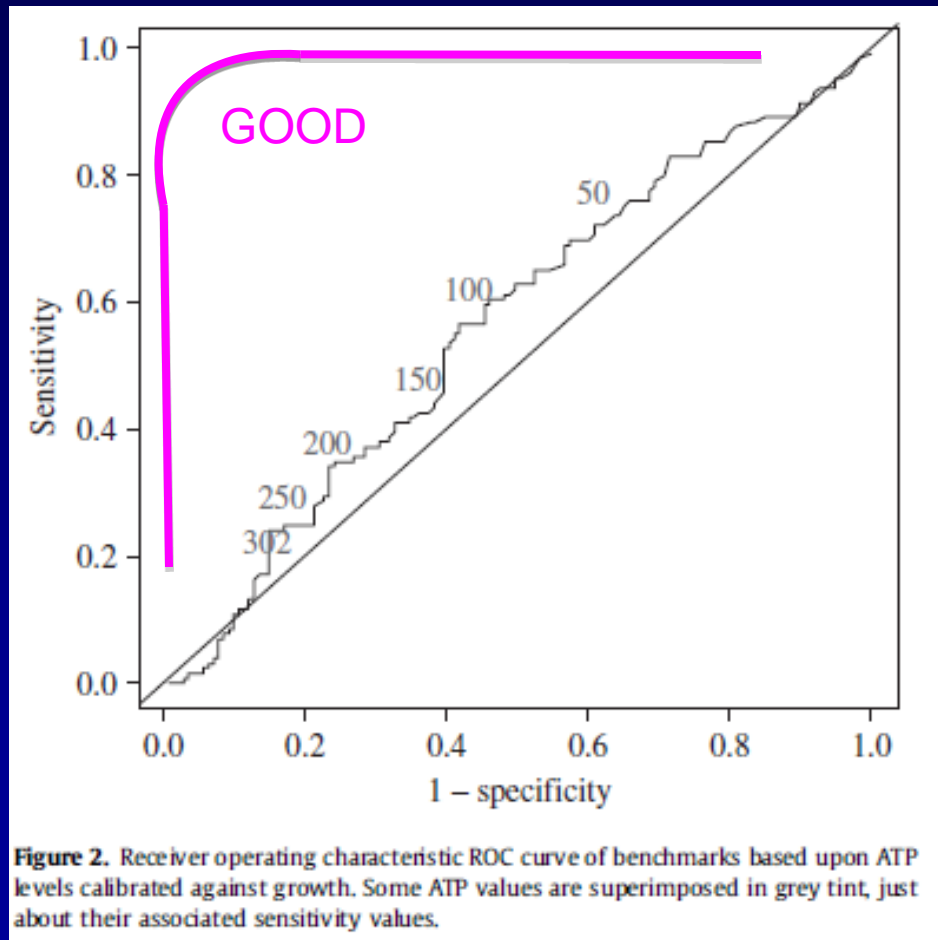

# Correlation between ATP bioluminescence (RLU/Swab) and aerobic colony count (cfu/swab)

# Correlation between RLU & Microbial Contamination. Mulvey D, et al. J Hosp Infect 2011

# Lack of Correlation between RLU & Microbial Contamination.

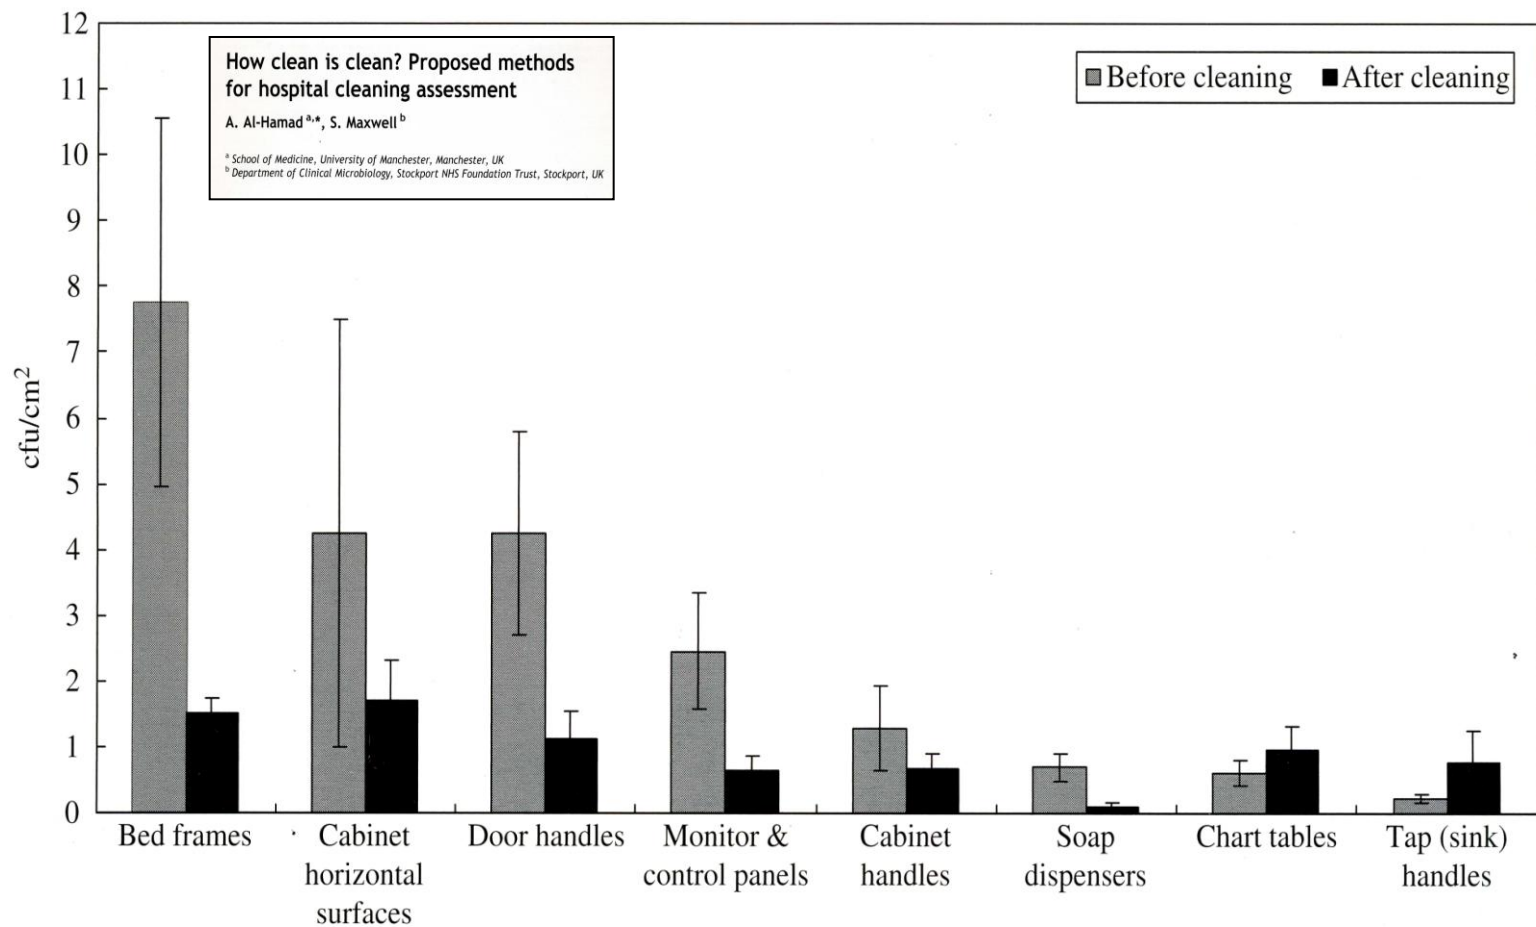

“Routine cleaning with detergent can reduce concentration of microbes & organic matter by RLU. The effect is not large, with many sites exhibiting similar values after cleaning as they did before. ...Further work is required to refine practical sampling strategy and choice of benchmarks.”

## Conclusion

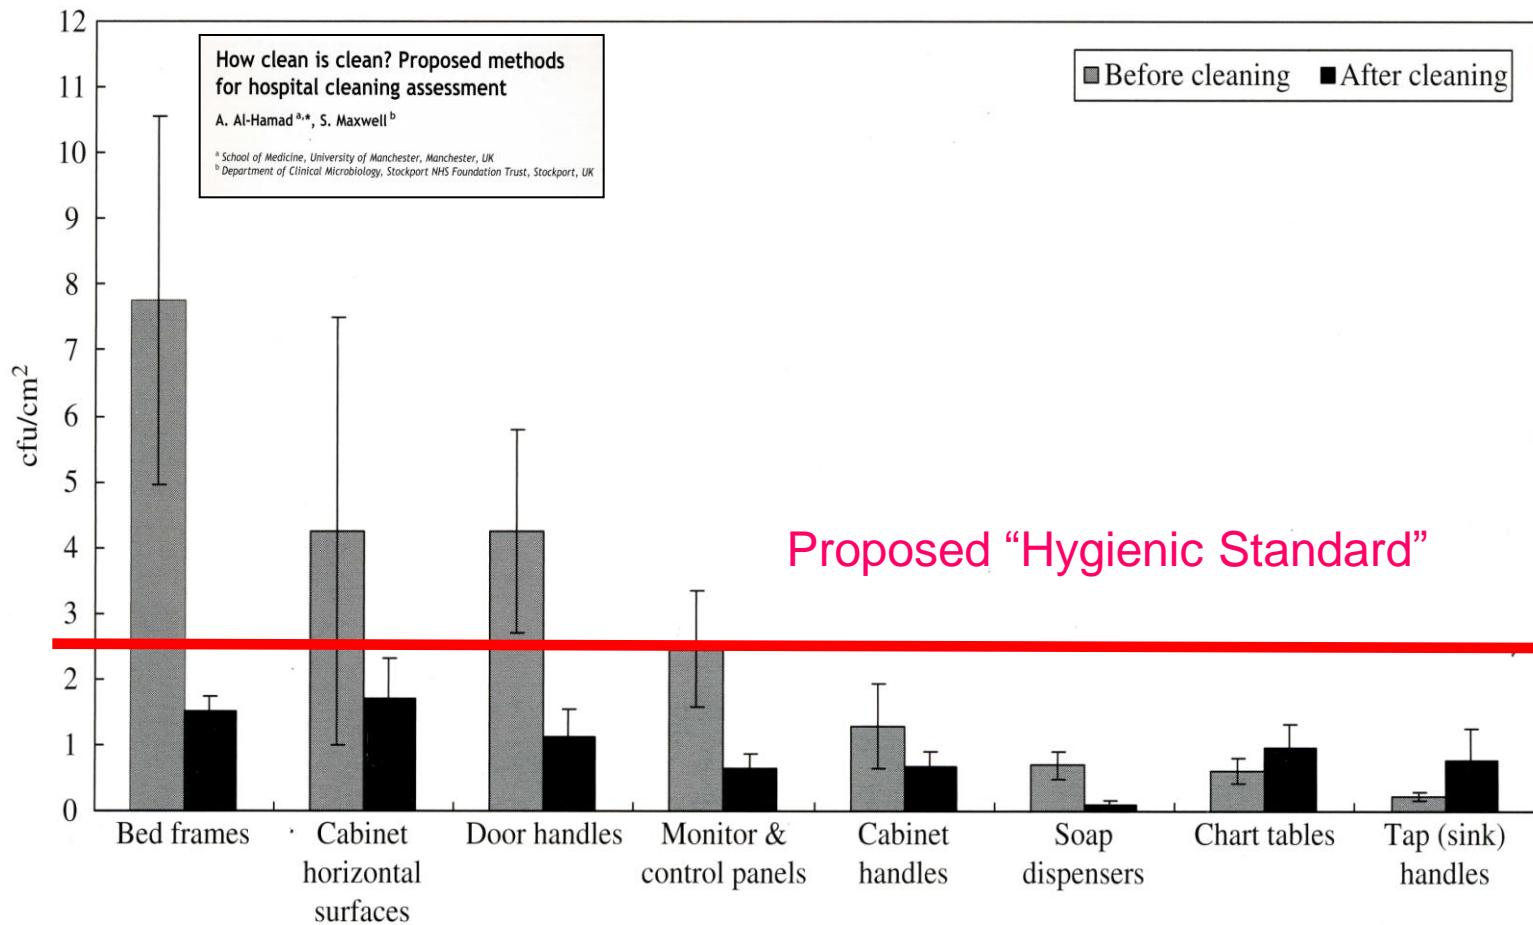

The range and diversity of the ATP results must be carefully considered. Despite monitoring in triplicate, occasional inflated values, for no apparent (visible) reason, skewed the overall results.<sup>4</sup> It is already known that organic soil contains both microbial and human DNA, as well as food debris and liquids.<sup>4,5</sup> ATP can also be confounded by disinfectants (bleach), microfibre products and manufactured plastics used in cleaning and laundering industries.<sup>21</sup> If ATP assessment is introduced into hospitals, it should be on the understanding that there will be inevitable failures that do not necessarily indicate true infection risk for patients. Sensitivity and specificity of 57% mean that the margin for error is too high to justify stringent monitoring of the hospital environment at present. Further work is required to fully assess routine ATP monitoring in hospitals.

The other problem with using an evaluation of cleanliness by agar dip slide or ATP

**Figure 1** Overall cfu/cm<sup>2</sup> ± SE from frequent-touch surfaces from clinical areas with cleaning policy.

**Figure 1** Overall cfu/cm<sup>2</sup> ± SE from frequent-touch surfaces from clinical areas with cleaning policy.

# Basic cleanliness\* of healthcare surfaces

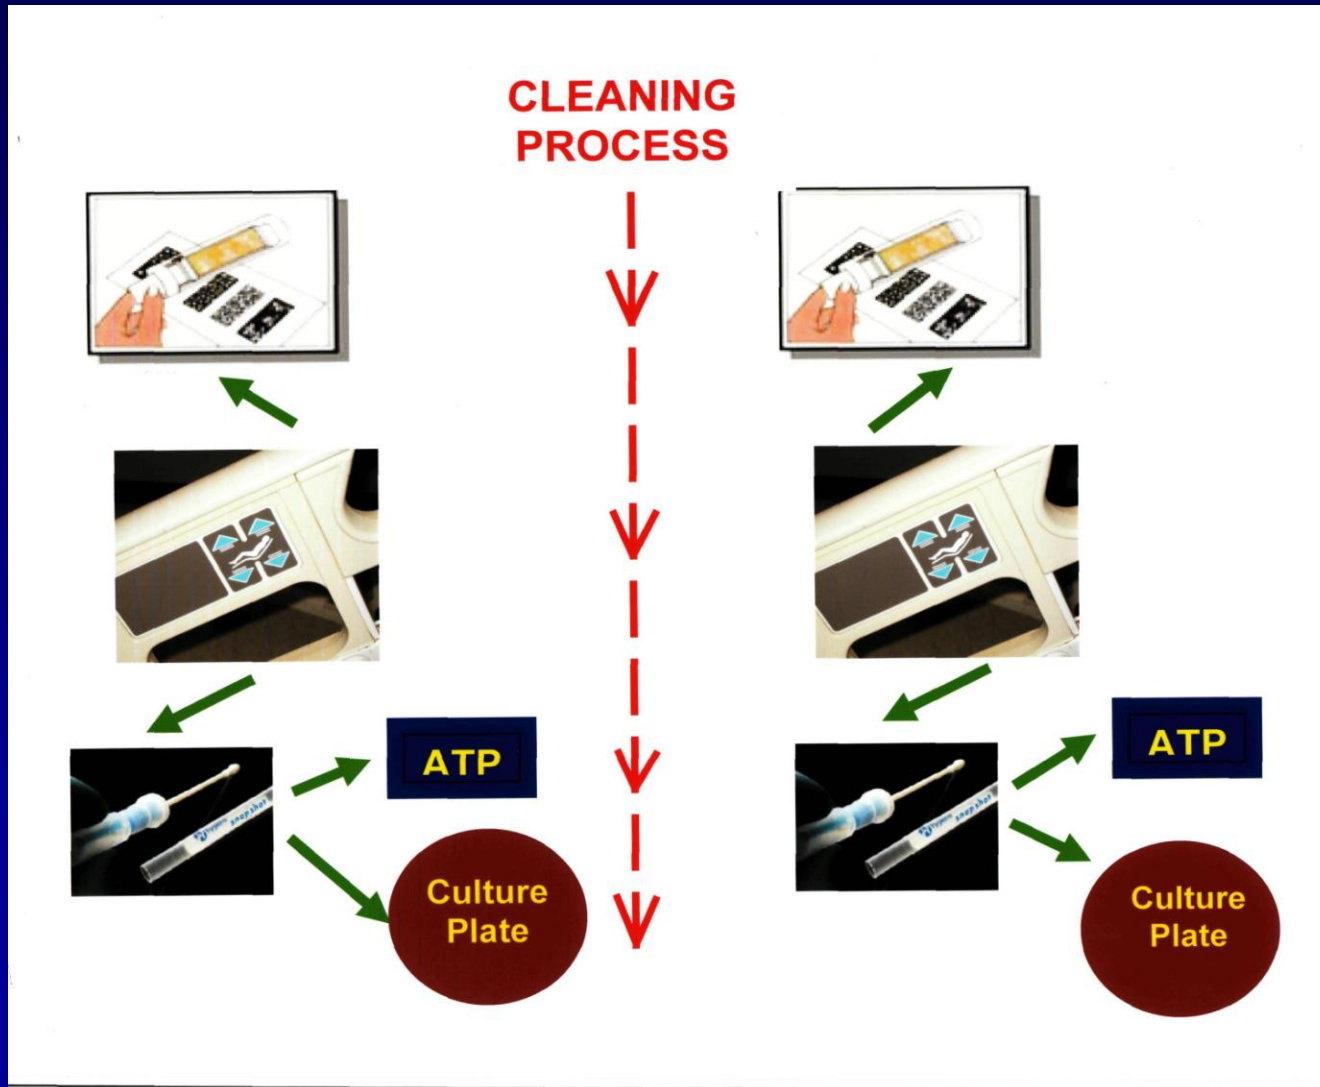

Nine Published studies 2006 - 2011

\* No aerobic growth or < 2.5 CFU/cm<sup>2</sup>

Despite their limitations, can dip slide cultures or ATP be theoretically used to evaluate cleaning practice?

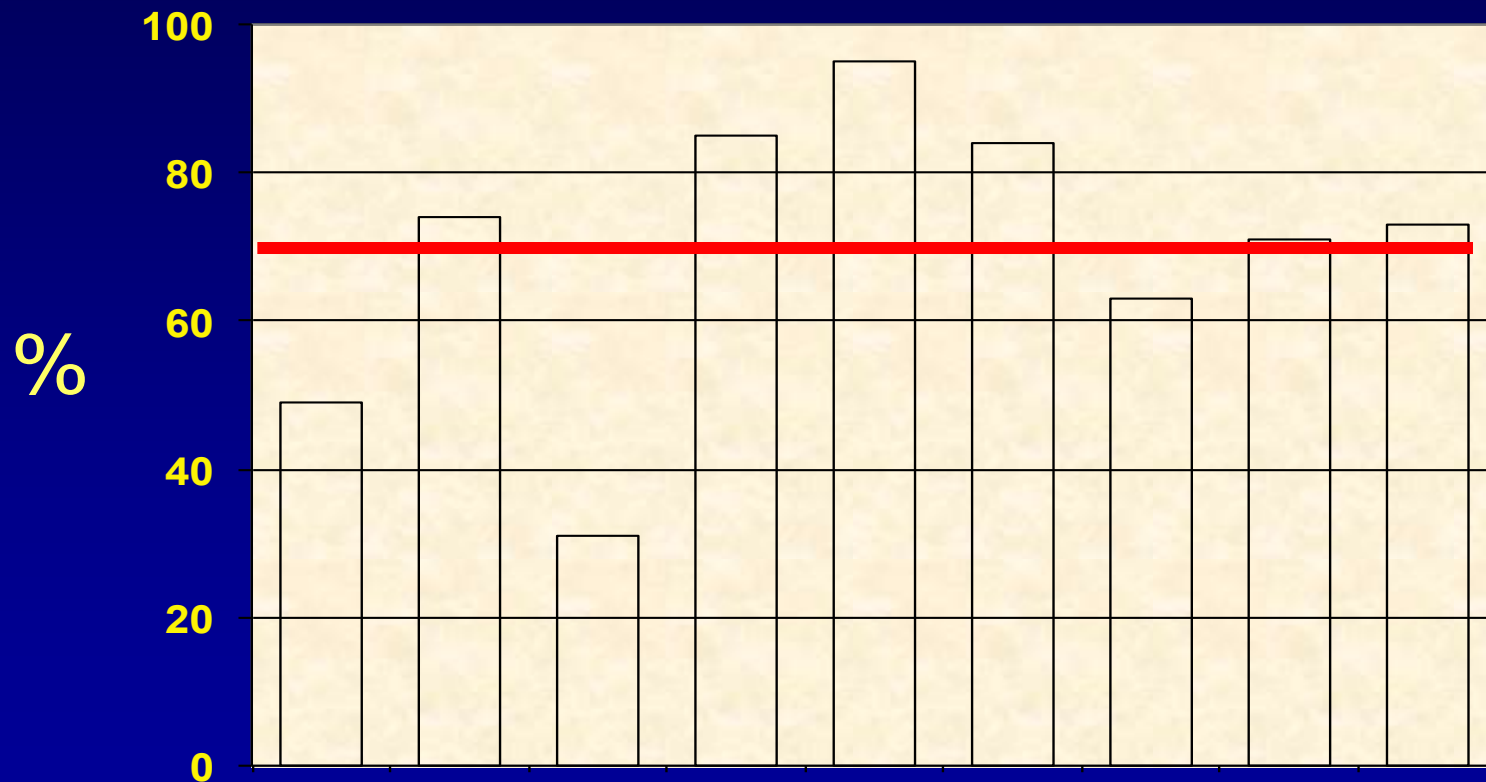

The CDC Guidance says yes.....But

# Using tools that measure cleanliness to systematically evaluate cleaning process

But then you will need to deal  
with the other implication of  
the.....

Most surfaces have too low a bioburden to evaluate... you need to mark two to three times the number of surfaces you planned to get an appropriately sized sample to detect a 20% change in process

Nine Published studies 2006 - 2011

\* No aerobic growth or  $< 2.5 \text{ CFU/cm}^2$

So what about the  
disinfectant?

# Don't forget the Rutala Equation

Product + Practice

# Issues with disinfectants, detergents, cloths, etc.

- What is the true role of bleach in disinfection cleaning?
- How effective will new green disinfectants be?
- When is it okay to use detergents?
- Where are we going with dwell time?
- Where does microfibre fit in?
- If effective killing with bleach takes many minutes, what is the clinical efficacy of bleach wipes?
- What is the correct amount of quat?
- Are disinfectants being mixed accurately?

So what about  
Hand Hygiene??

# Hand Hygiene Issues

What did Mark Anthony have to say about HH?

# Hand Hygiene Issues

Friends, Romans and Minnesota IPs,  
I come not to bury Hand Hygiene but to  
praise it (in context)

# Hand Hygiene Issues

Success stories were based on mixed interventions....Not enhanced HH alone

Logistical limitations are becoming clarified

There may be a “compliance ceiling”

Microbial efficacy – Product Differences

Microbial resurgence is rapid following HH

# HH in Complex Intense Environments is Very Difficult

30 to 40 HH “Moments” per Hour during direct patient care

# HH in Complex Intense Environments is Very Difficult

30 to 40 HH "Moments" per Hour during direct patient care

# How Rapidly does HH compliance deteriorate during a single patient encounter?

**THE  
ENVIRONMENTAL  
HYGIENE  
IMPERATIVE**

# Conclusions

- It is very likely that surfaces in the Patient Zone are of relevance in the transmission of Healthcare Associated Pathogens.
- While optimizing hand hygiene and isolation practice is clearly important there is **no reason** why the effectiveness and thoroughness of environmental hygienic cleaning should not also be optimized, particularly since such an intervention can be essentially resource neutral.

Thanks for inviting me !!

Questions – Comments?
